## Business Central Email Security

### Protection Against Threats through Email

Business Central Email Security is immediate email protection from malware and spam. When using email, you want to know you are protected against incoming threats to you and your organization, and SUTUS can offer you that protection through your Business Central.

Today's viruses, worms and Trojan downloaders target the primary weakness in anti-virus technology: the time it takes for new signatures or heuristics to be developed and distributed. There are typically thousands of distinct variants, and malware distributors often release hundreds of new variants per hour.

Leveraging patented technology from Commtouch, Business Central Email Security provides protection in the earliest moments of malware outbreaks, and continues as new variants emerge. RPD™ technology identifies viruses based on their unique distribution patterns, with no need for time-consuming signatures to identify suspect messages. Real-time protection, from real threats.

#### Capability of massive multi-variant malware

Rate of new distinct variants	100+ / minute
Average variant lifetime	2-3 hours
Typical signature/heuristic delay time	3-10 hours

### Set up and Management

Business Central Email Security offers the same single location administrative functionality as the Business Central. No client software installation is required. Any changes or additions will be updated for all email users. Your protection standards can be easily managed, keeping your email and systems secure.

### Features

- Equally effective for all languages and formats
- Real-time protection from the very first moment a new outbreak emerges
- Proven +98% detection rate
- The industry's highest accuracy levels (Osterman Research)
- A future-proof method – cannot be circumvented by spam/malware senders
- Fully automated detection
- Protects against server-side polymorphic malware, to complement traditional anti-virus
- Instant protection from new outbreaks – far ahead of signatures or software updates

### Immediate

Rather than evaluating each individual message, Recurrent Pattern Detection™ (RPD™) technology analyzes large volumes of Internet traffic in real-time. New spam and malware outbreaks are identified as soon as they emerge, and recorded in the Commtouch Detection Center.

### Signature-Less

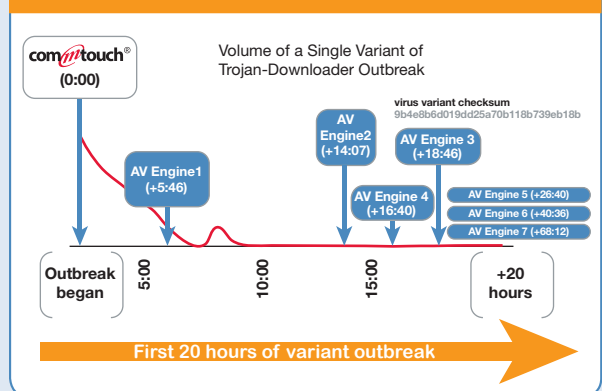

- Blocks or delays suspect messages hours before commercial signatures are available
- Shortens the signature-making process, thanks to immediate alerts of new viruses within minutes of their introduction into the Internet

### Proven

Commtouch email security technologies are:

- Deployed in 130 countries
- Protecting over 50 million mailboxes
- Recognized by IDC, Ferris Research, Osterman Research, Virus Bulletin
- Robust and inherently immune to emerging foiling attempts based on RPD technology

#### Protects in the first moments of outbreak
